

Porsche 928 Hi-Performance Auxiliary Fan

aka: Air Conditioning Fan

We have already configured this fan to function as a “pusher” fan in front of your radiator. It is ready to install.

Step 1: disconnect the existing fan from the wiring by unplugging it at the white-colored wire connector at the front of the car. Just follow the wires from the fan outward and you will locate this wiring connector easily.

Step 2: remove the existing fan from the car. Remove the mounting brackets also. There are two brackets on the top, and one bolt that comes up from the bottom to remove.

Step 3: lower the new fan into place and secure it to the air conditioning core with the special legs and radiator mounting ties provided. Trim off the extra length of the mounting ties.

Step 4: plug the new fan into the wiring connector as in Step 1 above.

All done! Remember: this fan only comes on if the Air Conditioning is on, or if the temp becomes hot enough.

Please call 877-FOR-928M if you have any questions.
